

Datawarehousing

Datawarehousing means:

- Analysing business requirements
- Identifying subject-entities to which Datawarehouses and datamarts must be oriented
- Designing the structure of Datawarehouses and datamarts to create a subject-oriented view with business intelligence implications
- Providing the client with a path to deal with key-issues, such as entity mapping, integration prospects, business intelligence, knowledge management, and data mining.

Datawarehousing makes you know what you need to know to run your business!

It enhances knowledge and does not let you forget what you already knew.

CONSULTING

ERP knowledge and expertise allied...

... in the quest for cost effective solutions!

Abbate Consulting

Abbate Consulting is an independent consultancy, operating mainly in Europe.

We especially target manufacture environments where product configuration is extremely complicated and tied up to customer specs. We operate directly with the client, by analysing the situation of his/her information system and by delivering development solutions for each intervention area.

Our operational methodology stems out of main IBM/Hewlett Packard project techniques which are being used in the ERP arena. Software quality issues are treated according to North-American models (American Society for Quality and Capability Maturity Model developed by Software Engineering Institute).

We consider this approach fundamental to create business efficient solutions for our clients, especially in key areas such as ABC costing, product configuration, and capacity requirement planning.

We are experienced in:

- ERP selection
- Supply chain management
- System integration
- Datawarehousing

ERP selection

ERP is the basement upon which any supply chain and customer relationship management architecture must be built: we took care of ERP selection and any other ERP consulting service to meet your requirements.

Our customers typically need:

- ERP selection guidance
- Evaluation of where to house systems (internal or outsourced)
- Project management by an independent consultant
- Assistance in understanding technical jargon and evaluating different ERP implementation methodology
- Change management and business reengineering alternatives
- Increase of enterprise integration

Our ERP selection process: your true partner!

Supply chain management

Abbate Consulting is here to:

- Analyse your requirements for ERP and product configurator customisation
- Understand your needs to run a MRPII within a supply chain
- Project your supply chain management and capacity requirement planning architecture
- Choose ERP, product configurator, and capacity requirement planning system
- Help your staff in implementing this final supply chain management system.

Supply chain management can be achieved through a variety of ERP and capacity requirement planning systems.

Our consultants focus on your goals with a customer-centric approach to add value to your supply chain and increase your customers' satisfaction.

System Integration

Customer relationship management can bring success to an organisation and upgrade its performance. However, success is built on access to data.

A system integration platform is critical to:

- Transforming and moving data between B2B/CRM modules and legacy applications
- Reconciling different data models to leverage data across B2B members and increase customer satisfaction
- Making data more accessible (there is no customer relationship management without full data accessibility)
- Ensuring the right data is available and "clean" to provide your staff with customer relationship management reports and analysis.
